Installing C-Bridge Software

==
Software only installation on standalone PC or VM
==

OS must be Centos Version 7.9. Version 7.9-2009 works well.

The c-Bridge software will run on many virtual machines, but not all.

Note: ssh will be on port 22 initially
Note: Disable firewall or open ports 42420 -> 42431 TCP and UDP
Note: if firewall is enabled, open any ports needed for IPSC

Using Putty, connect to the machine on which the c-Bridge software will be installed using SSH on port 22. You can also use a Terminal Windows on that machine as long as you have 'root' privileges.

Type the following commands:

cd /root and press ENTER.

wget rnalpha.dyndns.org:42420/GetFile?name=v_installer\&unix=1 -O v_installer and press ENTER

chmod +x v_installer and press ENTER

./v_installer and press ENTER

Note: Disable firewall or open ports 42420 -> 42431 TCP and UDP

Wait 3 minutes for the c-Bridge software to completely install. ***Do not press anything on the keyboard or turn off the computer until this period has elapsed.***

Using a web browser, go to **http:/xxx.xxx.xxx.xxx:42420/** ('xxx.xxx.xxx.xxx' is the IP address of your c-Bridge)

Log into the c-Bridge software using the follow credentials:

> User = **admin**
> Password = **tlnet**
> Select C**onfig** and then **System**
> Click on "S**upplementary ID**"
> Enter the serial number and the key that you were provided.
